1. Project Overview

The project is a tarot reading website, where users can experience an online version of selecting a random card from a spread of tarot cards. Users who want to test their knowledge of tarot cards can also experience flash card mode.

2. User Stories

- As someone who goes to tarot reading shops to get readings, I would like an alternative way to draw a random tarot cards for a quick reading instead of having to visit a shop every time.
- As someone who wants to learn how to do tarot readings, I would like a flash card of tarot cards to learn to match the image to the meanings.

3. Application Features

Features Overview:

When a user selects tarot reading mode, the user is given types of reading they can choose from. After selecting a type of reading, the app will generate a random spread of cards from which the user can select a number of cards. Proceeding to reveal the card will show the card and the associated meaning.

When a user selects flash card mode, the app will show an image of the card that is randomly generated. Users can then click the show meaning button to reveal the corresponding card meaning. Clicking the next button will generate a new image so that the user can continue the testing if they choose to.

Features List:

- **Tarot Reading Mode**
 - **Single Card Reading**
 - **Past Present Future (Three Card) Reading**
 - **Five Card Reading**
 - **Text Version of Selected Card(s)**

The application's Tarot Reading feature includes options for three types of reading: single card reading, past/present/future (three cards) reading, and five cards reading. Users can choose the type of reading.

Depending on the type of reading chosen, the users can select the corresponding number of cards from a spread of cards. The single card reading mode allows users to choose exactly one tarot card from a full card grid. The past/present/future (three cards) reading mode allows users to choose exactly three cards. The five card spread mode allows users to select five cards. The spread of cards are generated randomly to simulate a shuffled deck of cards spread out, faced down when doing a tarot reading in person.

Once the user proceeds to reveal the cards, the front image of the cards will be loaded and The selected cards are stored locally and displayed together on the reveal page with their meanings. Also included is a text of card or cards that was selected, in case the user wants to copy and paste the result.

- **Flash Cards Mode**

The application's Flash Cards feature is to act as a fun tarot learning tool. Each time the page is loaded, a tarot card is randomly generated and its image is displayed. Users can click the "Show Meaning" button to reveal the card's name and meanings, and then use the "Next Card" button to load a new page, which loads an image of another random card.

- **Data Used**
CSV Files

The app dynamically loads tarot card information from CSV data files instead of hardcoded JavaScript objects. This will allow the tarot database, meanings, and image mappings to be updated easily without modifying the application logic in the future, and hopefully make it easier to add more reading types and tarot card designs.

- **Navigation**
Accessibility Features
Mobile/Tablet/Desktop Views

The Tarot Web App includes a navigation system that adapts between desktop and mobile layouts. Card sizes and navigation behavior adjust to fit different screen widths. On larger screens the navigation buttons display horizontally, while on smaller screens a hamburger-style menu appears with expandable vertical navigation links.
